TRENDING — OCT 2026

# Jev is trending. What is it, and what is it actually for?

First what it is.

Then what it’s good for.

01 — THE PROBLEM

# Chatbots write text. You often need a short answer.

A Is this message a scam

B Which team owns this ticket

C Hold this request or not

02 — SO JEV DOES THIS

# So Jev returns not text, but a percentage.

A Example: “97% scam.”

B You ask one of three kinds of question:

C Yes or no. Pick one option. Score from 2 to 10.

03 — WHY A NUMBER HELPS

| | |
|---|---|
| Above 95% | ACT ALONE |
| In between | ASK A PERSON |
| Below 20% | LET IT GO |

# Draw the line by the cost of a mistake.

Example lines. Set yours by what a wrong call costs.

04 — THE CATCH

# Like a smoke alarm: no false alarms, many missed fires.

| | |
|---|---|
| What it flagged | ALL CORRECT |
| Attacks it found | ONLY HALF |

Seen in a test on prompt-injection attacks.

05 — SO TEST IT

# Skip the default line. Tune it on your data.

A The default 50% line is just a guess.

B Label a small sample of your own cases.

C Move the line until mistakes cost what you can afford.

06 — WHERE IT FITS

# Great for sorting.
# Not for math.

Keep the arithmetic in code.

| | |
|---|---|
| FRAUD | Normal, or hold it |
| TICKETS | Which team owns this |
| SORTING | Which topic is this |

07 — THE TAKEAWAY

# Chatbots for thinking. Jev for thousands of fast, small decisions.

01 Pick one decision your product repeats all day.

02 Ask for a percentage, not a paragraph.

03 Set the line by mistake cost, on your data.
